

BoosterpaQ Hydro MPC-ED

- The MPC-ED system maintains a constant pressure through continuous adjustment of the speed of two CRE pumps, while the CR pump is constant speed.
- One CRE pump always starts first. If the pressure cannot be maintained by the pump, the second CRE pump will be cut in. If the two CRE pumps cannot maintain the pressure, the fixed speed CR pump will be cut in.
- Pump changeover is automatic and depends on load, operating hours and fault.
